

# Remote Sensing: Garry Oak Species Detection

# What for and why now?

**Age of mapping:** Garry oak ecosystems were last mapped in 2006

**Quality of mapping:** Methods and accuracy have improved since 2006

**Scale of land use change:** Environmental regulations have been weakened and development regulations strengthened. The built environment is targeted for building density across greater Victoria.

**Building strong evidence:** Access to public high resolution data is limited. Community organizations have limited information to advocate for Garry oak protection and stewardship.

# What for and why now?

**Where are Garry oaks?** On private property: we don't know.

**Where are large Garry oaks?** On private property: we don't know.

**Is the population growing, or declining?** On private property: we don't know.

**Why the focus on private property?** 537,000 of 742,000 Saanich trees (72%) are on private lands (SUFR 2023)

# Why GOMPS?

**Capacity:** GOMPS has the technical capacity to develop an urban forestry remote sensing project, and the ability to fundraise the project.

**Strengthening partnerships:** GOMPS can contribute this dataset as high accuracy evidence to support other community organizations in their important work around Garry oaks.

**Organizational stability:** Enhancing our advocacy effort supports the recruitment of members, volunteers, donors, and draws attention to our nursery trees. It builds capacity to access grants.

# Why LiDAR?

**Historical Garry oak ecosystems of Vancouver Island, British Columbia, pre-European contact to the present (Lea, 2006):** Garry oak ecosystems are endangered in Canada with less than 10% remaining and less than 5% undisturbed relative to their abundance at European settlement.

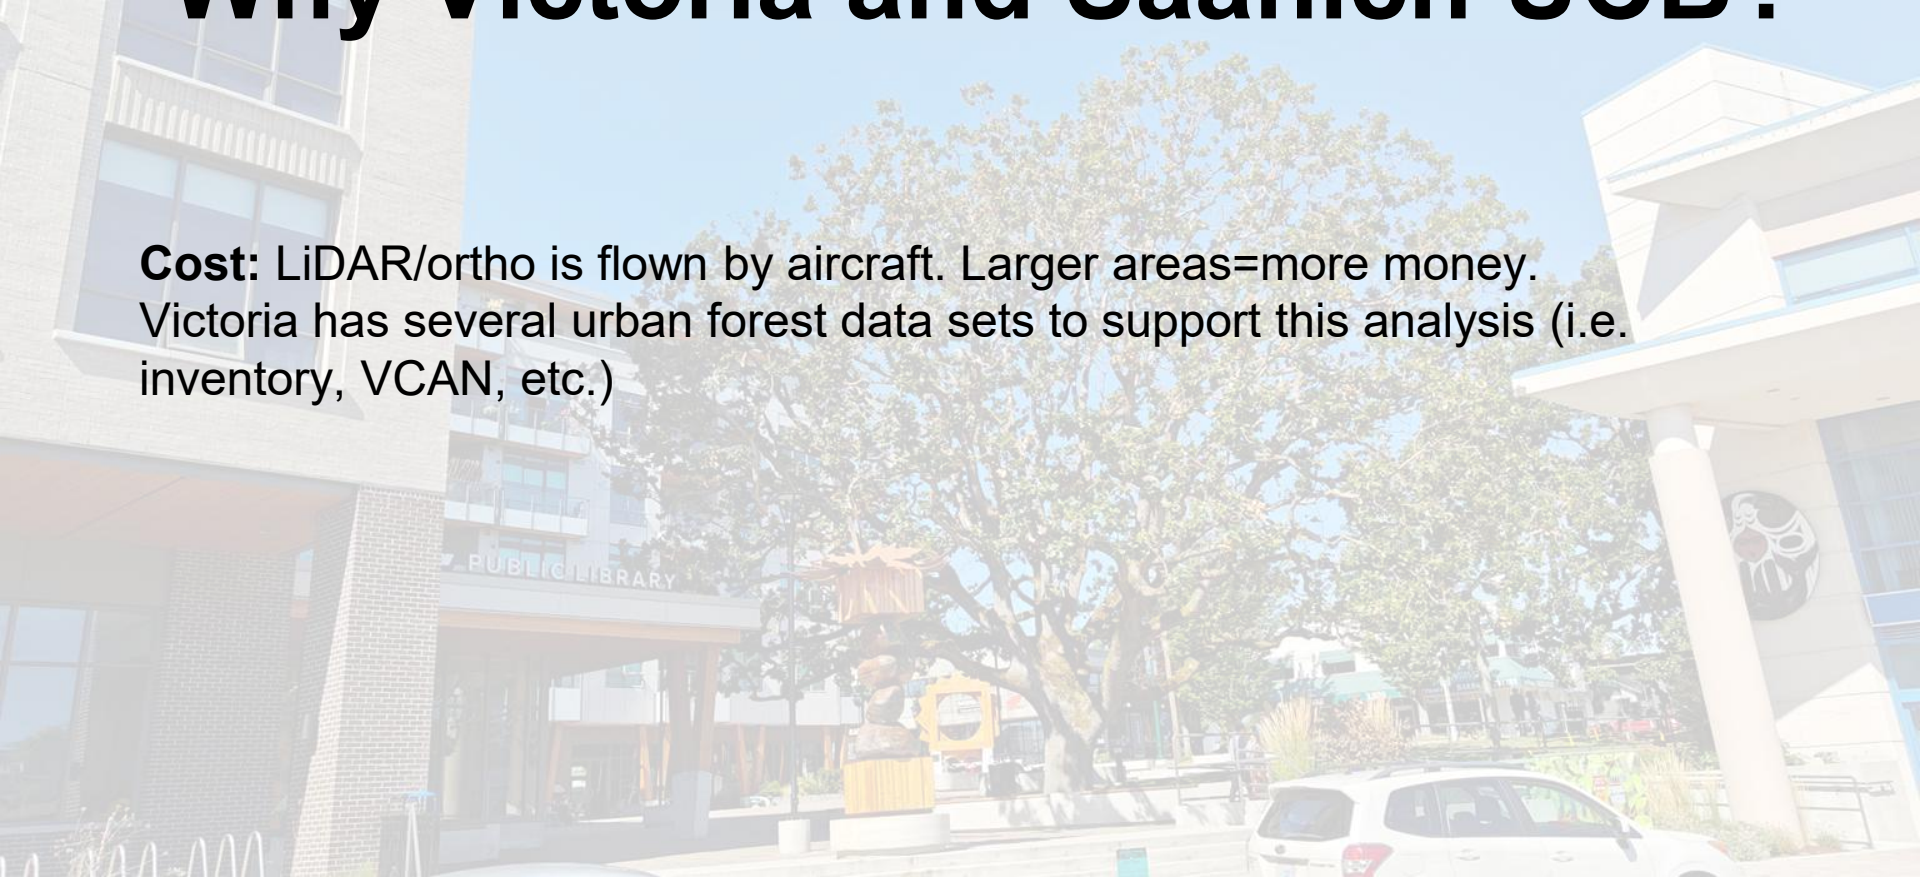

# Why LiDAR?

**Proof of concept:** GOMPS can develop a model of high accuracy species detection analysis for measuring an individual species that can be repeated in other jurisdictions (local and regional).

# Why Victoria and Saanich UCB?

**Cost:** LiDAR/ortho is flown by aircraft. Larger areas=more money. Victoria has several urban forest data sets to support this analysis (i.e. inventory, VCAN, etc.)

# Project specifications

## ***Project Location:***

City of Victoria and District of Saanich

- **AOI size:** 13,168 ha
  - **City of Victoria:** 2,188 ha
  - **District of Saanich:** 10,981 ha

## ***Spatial Reference Details***

- **Geodetic Datum:** NAD83(CSRS)/CGVD2013
- **Map Projection:** UTM, Zone 10N
- **Geoid Model:** CGG2013a
- **Units:** Metric

## ***Lidar Data:***

- Proposed density:  $\geq 20$  pt/m<sup>2</sup>, meeting these specifications:
    - 18 cm absolute vertical accuracy at 95% confidence on impervious single return surfaces
    - 36 cm horizontally at 95% confidence
    - Minimum 50% FL sidelap
    - Average nominal point density per square meter
      - Minimum for understory segmentation: 16 pt/m<sup>2</sup>
- Clearly demonstrable that the proposed altitude and laser rep / power settings would result in returns from bare earth, soil, vegetated surfaces based on sensor manufacturer specifications

## ***Imagery:***

- Proposed resolution: 10 cm
  - 4-band (RGB+NIR), stereo coverage
  - Optional RGB

# Goals

**Short term goal:** Acquire LiDAR and 4-band orthographic data, perform initial analysis, provide datasets to UBC MGEM students.

**Medium term goal:** Support community science, Indigenous governments and local governments' analysis and decision making, and build on academic research of Garry oak and Garry oak ecosystems with this open-access, high quality dataset.

**Long term goal:** Establish this method as a standard for municipalities across the CRD to run on their ongoing urban forest analysis, and share with other regions.

# What's next?

**Phase 1:** Fundraising, developing scope of work, selecting a contractor, and executing the scope of work for acquisition and baseline analysis \*COMPLETE\*.

**Detailed Analysis (Phase 2):** Take delivery of pre-classified raw datasets, provide datasets to UBC MGEM students, and begin technical meetings between contractor, GOMPS, and UBC MGEM for the geoprocessing tool development (project completion in late 2026)

**Outreach (Phase 3):** GOMPS will evaluate approaches to disseminate results beginning in early 2026.

# What's next?

**TRS:** Urban forest analysis (City-wide, zoning modernization, neighbourhood), gain/loss LiDAR classification, land cover and height classified LiDAR, 10cm aerial imagery.

**MGEM:** Course work and capstone proposals are underway.

Deliverables:

- Garry oak species detection overall area
- Garry oak species detection individual polygons
- Garry oak species individual tree inventory
- Accuracy assessments
- Open source methods (ArcGIS Pro)
